

ADMIN DASHBOARD — MASTER DESIGN PROMPT

Pharmacy Management System · MVP scope · Paste
everything below into your design tool

ROLE & CONTEXT

You are designing the **Admin interface** of a pharmacy management app for a real Nigerian community pharmacy. The app replaces a fully paper-based system. There are three roles — Attendant (phone), Cashier (desktop), Admin — and you are designing **only the Admin side**.

The Admin is the shop owner: an older, non-technical man who checks the app on his **phone in the evening** and occasionally on a desktop. Today he only sees revenue on a paper summary. This dashboard is the first time he will ever see profit, stock value, debts, and staff performance. Every design decision must serve one goal: **he understands his business in under five minutes, at a glance, without training**.

HARD DESIGN RULES

- **Mobile-first.** Design the phone layout as primary; show a desktop variant as a wider arrangement of the same

components. One-handed use.

- **Big text, big numbers, big touch targets.** Key figures are displayed like scoreboard numbers — large, bold, unmissable. No dense tables of tiny text.
- **Currency is Naira (₦)** everywhere, formatted with thousands separators (₦612,900).
- **Red is sacred.** Red appears ONLY for money-at-risk: failed backup, low stock, near-expiry, day-close mismatches, and outstanding debt. Never use red decoratively.
- **Credit is never confused with cash.** Any credit figure is visually separated (distinct badge/treatment) so a debt is never mistaken for money in hand.
- **Palette:** calm, premium, trustworthy — deep pharmacy green as the primary, warm off-white background, near-black text, a muted gold accent used sparingly for the profit figure only. Apple-grade restraint; no gradients, no decorative illustration, no generic "SaaS dashboard" look.
- **Typography:** a clear geometric sans for UI; numerals in a strong tabular weight so money figures align and command attention.

NAVIGATION

A simple 4-item navigation (bottom tab bar on phone, sidebar on desktop):

Overview · Products · Day History · Settings

SCREEN 1 — OVERVIEW (the main screen; design this in full)

Stacked top to bottom:

1. **Backup alert banner (conditional):** a full-width RED banner pinned at the very top: "⚠ Backup failed — data is not protected. Fix now." It cannot be dismissed until resolved. Show it in one state variant; show the normal state without it.
2. **Today's money — split by method:** large total income figure, then a clean breakdown: Cash ₦231,500 · POS 1 ₦148,200 · POS 2 ₦96,700 · Transfer ₦89,100 · Credit ₦47,400 (Credit visibly badged as "owed, not received").
3. **Profit today (Admin-only figure):** the hero number of the screen — Sales — Cost of goods — Expenses. Example: **₦187,300**. Give it the gold accent. Small caption: "Profit after cost of goods and expenses."
4. **Sales counts beside money:** "Today: **142 sales** · ₦612,900". Counts sit next to revenue everywhere, because a count shows how busy the shop truly was, separate from how much money moved.
5. **Attendant leaderboard (today):** every attendant ranked highest first, each row showing name, personal sales count, and sales value. Example: Chidinma — 34 sales · ₦128,400 / Emeka — 29 sales · ₦104,750 / Ngozi — 25 sales · ₦88,200 / Ifeoma — 21 sales · ₦71,900. Top attendant subtly highlighted.
6. **Total owed (credit outstanding):** one clear figure, e.g. ₦164,300, with a tap-through hint "See everyone owing

→ " — the list shows customer name, phone, amount, date.

7. **Expenses today vs limit:** e.g. ₦18,500 of ₦25,000 limit, with a simple progress indicator that turns red when the limit is crossed.
8. **Stock value snapshot:** total value of goods on the shelves, with counts of red flags: "6 items low stock · 3 near expiry".
9. **Alerts feed:** a short chronological list of instant alerts: "Credit sale — Mrs. Okafor, ₦12,400, by Chidinma · 2:14 PM", "Expenses crossed daily limit · 4:02 PM", plus the daily closing summary entry.

SCREEN 2 — PRODUCTS

- **Searchable product list:** each row shows product name, category, selling price, **stock left**, and **nearest expiry date** — with a red flag on low-stock rows and near-expiry rows. Include a filter chip row: All · Low stock · Near expiry.
- **Add/Edit Product form:** name, category, **cost price** (marked "visible to Admin only"), selling price (retail; optional wholesale), **unit chain** (e.g. 1 tin = 20 sachets = 200 tablets, with a price at each level), barcode, low-stock level, supplier.
- **Receive Stock (batch) form:** scan/search product, quantity received, true cost price paid, expiry date on the pack. Note on screen: "Sales always take from the earliest-expiring batch first."

SCREEN 3 – DAY HISTORY

- A list of every closed day: date, total income, profit, and a status chip – **Balanced** (green) or **Mismatch ₦X** (red, showing the exact gap).
- **Day detail view:** system figures per payment method side-by-side with the cashier's hand-counted figures, the ₦200/₦100/₦50 change float, differences highlighted in red, who closed the day and when. The day is locked – read-only.
- From an order inside a day, an **Admin-only Cancel/Refund action:** choosing it demands a written reason; the record is never deleted – the correction is added on top with name, reason, and time visible.

SCREEN 4 – SETTINGS

- **Daily expense limit** (₦ input) and **mismatch alert limit** (₦ input).
 - **User accounts:** exactly six – 4 Attendants, 1 Cashier, 1 Admin – each with name, role badge, and reset-password action. A visible rule line: "One person, one login."
 - **Backup status:** last successful backup date/time, green when healthy, red with a warning when failed.
-

STATES TO INCLUDE

- Overview with and without the red backup banner.

- A Day History row in Balanced state and in Mismatch state.
- One empty state (e.g. "No credit sales today") written as a plain, calm sentence — never a sad illustration.

DO NOT INCLUDE (excluded from MVP on purpose)

No graphs or trend charts, no margin/KPI analytics, no attendant ranking history, no treatment/patient module, no debt-aging buckets, no restock suggestions, no SMS reminders, no export buttons. These come in later phases — designing them now would mislead the build.

OUTPUT

Deliver each screen as its own clean mockup (phone layout primary, desktop variant for Overview), using the realistic Nigerian sample data above — real names, real Naira figures, never lorem ipsum. Name them to match: `admin-overview.png`, `admin-products.png`, `admin-day-history.png`, `admin-settings.png`.
